

Headings

Headings define structure and hierarchy. They're not for styling; they're for meaning (SEO + accessibility).

```
<h1>Main Page Title</h1>
<h2>Section Title</h2>
<h3>Subsection</h3>
<h4>Minor Heading</h4>
<h5>Small Heading</h5>
<h6>Tiny Heading</h6>
```

Rules that matter:

- Use one `<h1>` per page (the core topic).
- Don't skip levels randomly (`h1 → h3` is bad structure).
- Style with CSS, not by choosing smaller headings.

Paragraphs

Paragraphs are for blocks of text content.

```
<p>This is a paragraph of text.</p>
<p>This is another paragraph.</p>
```

Line Breaks

Use line breaks when text should stay in the same paragraph but move to a new line.

```
<p>
Hello<br>
How are you?<br>
I'm fine.
</p>
```

Important:

 is an empty tag (no closing tag).

Common Beginner Mistake

-  Using
 to create spacing instead of paragraphs
-  Using headings to make text bold or big

Correct mindset:

- Structure with HTML
- Style with CSS
